

Script Sentinel

Regression test your Shopify Plus checkout Scripts before Shopify shuts them off on June 30, 2026. Prove your new Functions behave identically to your old Ruby Scripts before customers find out they don't.

(Working name. Final name TBD — also considered: ScriptParity, FunctionGuard, Scripts SOS.)

The problem

Shopify is sunsetting Shopify Scripts on **June 30, 2026**, with editing/publishing blocked from **April 15, 2026**. Plus merchants currently run revenue-critical logic through Scripts:

- BOGOF and gift-with-purchase offers
- Tiered discounts by spend or quantity
- Customer-specific pricing (B2B, VIP tiers, employee pricing)
- Postcode-based shipping rules
- Payment method hiding/reordering
- Market-specific pricing logic

When Scripts go off, all of that logic must be reimplemented in Shopify Functions. Shopify provides migration guidance and a customizations report. What Shopify does not provide: a way to prove your new Functions produce the *same outputs* as your old Scripts on the same cart inputs.

The result: merchants migrate, deploy on a Tuesday, discover during BFCM that their tiered discounts now stack differently than they used to, and lose six figures in 48 hours before anyone notices.

This is a regression testing problem. Nobody is solving it.

Who this is for

Buyer: Shopify Plus ecommerce ops lead, technical founder, or in-house Plus developer

at a store that:

- Currently runs at least one Shopify Script
- Has revenue-critical promotion logic (not just decorative discounts)
- Already pays for discount, shipping, or checkout apps in the \$49–\$399/month range
- Has been told by Shopify, an agency, or a consultant that they need to migrate
- Is panicking about June 30 because their Scripts have been running unmodified for 3+ years and nobody remembers exactly what they do

Not for: Non-Plus merchants (no Scripts), agencies who already have internal migration tooling, stores with zero promotion logic, manufacturers who don't do checkout customizations.

What it does

The audit (one-time deliverable, \$199–\$499)

- Discovers all active Scripts on the store
- Classifies each Script by domain (discount / shipping / payment / market pricing)
- Pulls the last 90 days of order data
- Builds a cart-fixture library from real historical orders
- Runs each fixture through the merchant's existing Scripts (or against historical order outcomes as ground truth)
- Generates a "what your Scripts actually do" report — including edge cases the merchant has forgotten about
- Outputs a Migration Risk PDF with prioritized findings

The regression suite (recurring, \$149/month)

- After the merchant deploys their new Functions, runs the same cart fixtures against the live Functions
- Diffs Function output vs Script baseline: discount amounts, line item modifications, shipping rates, hidden payment methods
- Alerts on mismatches before they hit production
- Grows the fixture suite over time as new edge cases appear in real orders

The launch gate (recurring, \$299/month, multi-customization tier)

- Same regression coverage extended to shipping rules, payment customizations, B2B pricing, market-specific logic
- BFCM/promotion launch QA: every new discount runs against the fixture suite before going live
- Slack/email alerts on production drift

What it deliberately does not do

- **No Function authoring.** Function Junction and others do this. We test what you wrote, we don't write it for you.
- **No Script-to-Functions auto-conversion.** Bespoke Ruby logic is too varied to safely auto-translate. We tell you what to convert; you (or your agency) writes it.
- **No discount creation UI.** Discount Ninja and Regios own this. We are not a promotion designer.
- **No non-Plus support.** Scripts only run on Plus; this product only serves Plus.
- **No multi-platform.** Shopify only. WooCommerce, BigCommerce, etc. have different problems.
- **No general checkout monitoring.** Elevar and Analyzify cover post-checkout tracking. We focus on cart-time logic parity.

Saying no to these is the wedge. We are the regression test layer for a specific migration. Nothing more.

Why it survives competitive review

Risk	Mitigation
Discount Ninja, Regios Automatic Discounts, or another incumbent app adds Scripts migration help to retain customers	They are promotion designers, not parity testers. Their pricing power is in <i>creating</i> discounts. The diagnostic-only wedge is unattractive for them to bundle because it commodifies the riskiest part of their sale.
Function Junction or similar builders bundle a "test mode" feature	Function Junction has 11 reviews and weak distribution. Their incentive is to sell Function authoring, not validate parity against legacy Scripts they didn't write.

Migration consultants and agencies (e.g., the consultant pitching directly in the Shopify Community Plus thread) compete on the same buyer	Agencies cost \$5K–\$50K per migration project. Our \$199–\$499 audit slots in <i>before</i> the agency conversation, not against it. The pitch becomes “run the audit so you know exactly what to ask the agency for, or whether you need them at all.”
Shopify ships a native parity tester	Shopify’s incentive is to make migration painless, not to expose how often Functions diverge from Scripts. They have not built this and have not signaled they will. The customizations report is informational, not validating.
The deadline window closes June 30, 2026 and the product evaporates	The audit revenue is front-loaded (April–June 2026 is peak demand). The recurring monitoring product survives because: (1) Plus merchants iterate on Functions continuously, (2) BFCM and seasonal promotions need regression QA every cycle, (3) the fixture suite becomes a permanent QA asset.
Plus merchants don’t trust a \$199 SaaS with revenue-critical promotion logic	Read-only access only. Never write to production checkout. Never deploy a Function on the merchant’s behalf. The product reports; the merchant decides. Audit log every operation.

The competitive landscape (verified)

Direct app competitors (none own this wedge):

- Discount Ninja — \$49–\$399/mo, 178 reviews. Promotion designer, not parity tester.
- Regios Automatic Discounts — \$29.99–\$99.99/mo, 158 reviews. Functions-era discount builder, no migration validation.
- Function Junction — free + usage up to \$900/mo, 11 reviews. Function authoring, not parity testing.
- Advanced Shipping Rules — \$9–\$99/mo, 300 reviews. Shipping configuration, not Script migration.

Indirect competitors (the actual battlefield):

- Independent Shopify Plus consultants on LinkedIn and Shopify Community offering Script→Functions migration as a service for \$5K–\$25K
- Plus partner agencies (Tinuiti, BVA, We Make Websites, etc.) offering migration as a

project line item

- Internal merchant developers attempting migration without external help

Our positioning: the diagnostic step *before* hiring a consultant, or the QA tool for the in-house dev. We are upstream of the agency relationship, not competing with it.

Pricing

Product	Price	What it delivers
Migration Risk Audit	\$199 one-time	Single Script family scan, cart fixtures from 90 days of orders, Migration Risk PDF report
Multi-Script Audit	\$499 one-time	All Script families (discount + shipping + payment + market pricing)
Regression Suite (Discount)	\$149/month	Continuous parity testing for discount Functions, alert on drift
Regression Suite (All)	\$299/month	All customization types, BFCM/promotion launch QA, multi-market
Audit + 3 months Regression	\$499 bundle	Audit deliverable + 90 days monitoring through migration cutover

Shopify Managed Billing only (mandatory for App Store apps). 14-day free trial on subscription tiers. Audit is paid-only — no free trial; the deliverable IS the product.

Tech stack

- **App framework:** Remix + Shopify App Template (TypeScript), Plus-only target
- **UI:** Shopify Polaris + App Bridge
- **Database:** Postgres (Prisma ORM)
- **Hosting:** Fly.io or Render
- **APIs:** Shopify Admin GraphQL API (2026-04+), Order History API for fixture generation, Functions API for output capture
- **Script behavior baseline:** Two strategies, supported in parallel:
 1. **Order-history inference** — extract historical discount/shipping/payment

outcomes from past orders, treat them as ground truth

2. **Manual baseline capture** — merchant runs a guided session describing expected behavior for synthetic carts

- **Diff engine:** Custom comparison logic per customization type. Discount diffs at line-item resolution. Shipping diffs at rate-shop resolution. Payment diffs at method-availability resolution.
- **PDF generation:** React-PDF for audit reports
- **Background jobs:** BullMQ or pg-boss for fixture replay and Function output capture
- **Observability:** Sentry + structured logs

Hard architectural commitment: Read-only against production. Never write a discount, never modify a Script, never deploy a Function. The product observes and reports. Period.

Operating principles

1. **The audit is the cash. The monitoring is the retention.** Build the audit revenue stream first; subscriptions follow.
2. **Read-only forever.** Any feature request that requires writing to checkout is rejected.
3. **Stay diagnostic, not prescriptive.** We tell merchants what their Scripts do and what's at risk. We don't tell them how to write the Function. That's their job, or their agency's.
4. **Plus only.** Saying no to non-Plus merchants is what makes the buyer wealthy enough to pay \$199–\$299/mo without thinking.
5. **The fixture suite is the moat.** Every audit grows the library of real-world Script behavior patterns. A competitor can copy the UI; they cannot copy 6 months of accumulated cart fixtures.

Status

Currently pre-Slice 0. No production code written. Distribution validation in progress.

Deadlines that shape the project

- **April 15, 2026** — Shopify blocks editing/publishing of new Scripts. Merchants can

no longer modify what they have. Panic begins.

- **June 30, 2026** — Scripts shut off entirely. Migration must be complete and tested.
- **April 29, 2026 (today)** — 61 days until shutoff. Slice 0 must complete in 7 days; audit MVP must ship in 14 days; full product by mid-May.
- **May 15, 2026 target** — App Store listing live, first paying audit customers.
- **June 1–30, 2026** — Peak audit revenue window. Marketing focused on “X days until your Scripts go dark.”
- **July 2026 onward** — Audit revenue tapers; subscription monitoring becomes primary revenue line.
